## The analysis of typological data

Michael Cysouw
Leipzig Spring School on Linguistics Diversity

## Survey of this course

I. Collecting data

- Choosing Languages
- Establishing Types

2. Implicational Universals (and the like)

- The typological tradition
- Statistical view of things
- Dryer's test
- Summing up parameters (don't !)

3. Semantic Maps (and other graphs)

- The typological tradition
- Taking frequencies into account

4. Relationships between languages

## I. Collecting data

- Investigate worldwide linguistic diversity
- Sample the world's languages
- Classify languages into types
- Any results are statements about actual and not possible human language !
- By sampling, only major types are captured

## Choosing languages

- Tradition: sample from linguistic families
- Indeed: don't take 20 Indo-European languages and 5 other
- Watch out for large areal consistencies !

## Diversity Sample (from Ö. Dahl, forthcoming)

## Choosing languages

- Tradition: sample from linguistic families
- Indeed: don't take 20 Indo-European languages and 5 other
- Watch out for large areal consistencies !

## Choosing languages

- Tradition: sample from linguistic families
- Indeed: don't take 20 Indo-European languages and 5 other
- Watch out for large areal consistencies !
- Watch out for internal variation in families !

## Establishing types

- Don't group the dissimilar !
- Specify internal structure of types
- Based on definitional structure of types
- Based on empirical measures of similarity

## Undifferentiated Typology

## Including Similarities

## Undifferentiated Typology

|  | $\mathrm{T}_{1}$ | $\mathrm{~T}_{2}$ | $\mathrm{~T}_{3}$ | $\mathrm{~T}_{4}$ | $\mathrm{~T}_{5}$ | $\mathrm{~T}_{6}$ | $\mathrm{~T}_{7}$ |

## What do statisticians say?

A windows version of this procedure is available here

## Dryer's test

## Summing up parameters (Don't !)

## Sum of Head and Dependent marking: 'complexity':

'.. the complexity (Dependent points plus Head points ...) has a roughly normal distribution. Neither zero complexity nor the theoretical maximum complexity of [18] points ( 9 Head points plus 9 Dependent points ...) occurs. the highest attested complexity is 15 , found in only two languages. Figure 4 shows the complexity values attested in my sample. ... The normal distribution and preference for moderate complexity shown in the overall sample are echoed in most ... areas, with high complexity predominating in only two.' (Nichols 1992: 88-89)

Ratio of Dependent and Head points: indicating the relative strength of head or dependent marking in a language.

'.. computing the ration of dependent to head marking ... gives us 35 different ratios among the 174 sample languages. Their distribution is shown in figure 1. It is bimodal, with the greatest peaks at the extremes of exclusive head marking (ration of zero since $\mathrm{D}=0$ ) and exclusive dependent marking (since $\mathrm{H}=0$, an actual ratio cannot be computed as it has a zero denominator). The other ratios, whose without zeroes, run from 0.14 (two languages) to 8.00 (one language). The highest frequencies are:

```
0.00 34 languages (radically head marking)
0.17 9 languages
0.50 8 languages [should be '0.33', MC]
1.00 11 languages
2.00 12 languages
H=0 19 languages (radically dependent marking)
```

... The other three frequency peaks suggest that preferred patterns cluster at perceptually simple ratios: two to one, one to one, and one to two. Overall, then, we have a preferecne for neatness of some sort: polar types, two-to-one ratios and even splits.' (Nichols 1992: 72-73)

## 3. Semantic Maps

- Traditional view
- Extension of Implicational Hierarchy
- Multidimensional Scaling

## Extension of Hierarchy

Guarani: first/second prn - third prn - human $\mathrm{N}-$ animate N - inanimate N

Usan: first/second prn - third prn - human N - animate N - inanimate N
Tiwi: $\quad$ first/second prn - third prn - human N - animate N - inanimate N
Kharia: first/second prn - third prn - human N - animate N - inanimate N

English: first/second prn - third prn - human N - animate N - inanimate N

## 4. Relationships

## between languages

- Universality: linguistic diversity interpreted as a-historical generalisations
- Contingency: linguistic diversity interpreted as result of historical processes

# Using Typological Data for Genealogical Investigations 

Dunn, Michael, Angela Terrill, Ger Reesink, Robert A. Foley \& Stephen C. Levinson. 2005. Structural Phylogenetics and the Reconstruction of Ancient Language History. Science 309: 2072-2075.

Dunn et al. tree based on typological data

## Measuring typological stability

- Given an accepted tree, with many languages sampled from this tree
- how good does a typological feature predict this tree
- Energy-based measurement of fit between a dataset and a tree (work by Mihai Albu)
- Take a large set of random trees, and determine how good the "real" tree fits

## Distribution of fits of all 125 features

(Too) many good fits!

## Oceania

| Maori | .062 |
| Tukang Besi | .048 |

## Investigation typology/geography relation

## Linguistically 'too similar’

## Linguistically 'too similar’

## Summary

- Typology is correlated to genealogy
- but: typology is also correlated to geography
- When removing the (genealogically related) Austronesian languages, the typology/ geography correlation improves
- The language-pairs that are typologically more similar than expected from geography are genealogically related

## Towards an

## interpretation

- In longterm static (areal) interaction typological features diffuse individually, leading to regular geographical clines
- In relatively recent (genealogical) spread bundles of features 'move' together, leading to stronger similarities as expected from geography

## Eurasia

## MDS of typological distances

## MDS of typological distances

## Some interpretation

- Turkish and Hungarian are cases of relatively recent movement of whole languages
- But Lezgian (probably) not
- Link Hindi-Hungarian is unclear, and Burushaski-Basque is too cranky a speculation
- Chukchi, Georgian, Abkhaz simply unrelated, both genealogical and areal
